Whole Structure Bed Bug Fumigation

100% Effective Against Bed Bugs

When bed bug infestations are extensive and immediate eradication is required, Vikane® gas fumigant is the best solution.

Bed bugs are an introduced pest and can hitchhike their way back at any time. That's why your participation is essential in keeping your home bed bug free.

A 30-day limited bed bug warranty begins on the day after the structure is declared safe for re-entry. During the 30-day limited warranty period, if bed bugs are found to be present in the structure, Thrasher will provide localized bed bug treatment at no additional charge. For the limited warranty to remain in effect, the following provisions must be met by the Client:

1. No additional furniture or bedding (new or used) is brought into the structure.
2. No luggage either owned by the Client or guests may be brought into the structure.
3. No new occupants take up residence in the structure, including temporary guests.
4. Client maintains the structure free from factors contributing to infestation included, but not limited to, factors listed in documentation provided by Thrasher Termite & Pest Control, Inc.

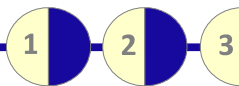

Your Preparation

You will be provided a very detailed list of preparation instructions. These include—

- Remove or double-bag anything that may be ingested: food, drugs, medicinals, spices, etc.
- Take only what you need, do not bring luggage. Put clothes fresh from the dryer in a new plastic bag or new, clear plastic tub.
- Make accommodations for 2-nights away from home.
- We will contact your utility company to turn off the gas. You need to contact the utility company to have the gas turned on after the fumigation.

Fumigation

DURATION

3 days, 2 nights

Originally developed by the Dow Chemical Company, sulfuryl fluoride is in widespread use as a structural fumigant insecticide to control drywood termites, it is also used to control bed bugs, rodents, powderpost beetles and bark beetles.

Vikane gas fumigant is 100% effective against bed bugs. Vikane has been trusted for nearly half a century in the treatment of more than 2 million structures. It's the best option for total-home drywood termite protection and bed bug elimination.

Because it leaves no residue, sulfuryl fluoride provides no protection from future infestations. Bed bugs are an introduced pest and can hitchhike their way back at any time. That's why your participation is essential in keeping your home bed bug free.

Return Home

- Contact utility company to turn gas back on.
- Launder clothes that you removed from your home during the treatment.
- Before returning anything to your home, inspect all items for bed bugs and clean all items.

What to Expect

When will I see results from the treatment?
Immediately.

How long will the treatment last?

There are no lasting effects. All bed bugs are killed by our treatment; however, bed bugs are an introduced pest and may reenter your home at any time.

What if I see more bed bugs?

Call us immediately. Our 90-day limited warranty covers localized bed bug treatment as long as you have followed our instructions for keeping bed bugs out.

Does fumigation leave a residue?

Vikane gas fumigant completely dissipates from the structure being fumigated and leaves no surface residue, odor or film behind, eliminating the need to wash linens, clothing or other items after fumigation.

What precautions are taken to ensure my family's safety?

- We release a warning agent during fumigation to deter entry to the home until it is safe to enter.

- We secure doors on your home using barricades or additional locking devices to prevent unauthorized entry.

- We use specialized equipment to test the air to ensure that Vikane has dissipated so that you may re-enter your home. The Vikane level must be below the U.S. Environmental Protection Agency (EPA) requirement (1 ppm or less) in all breathing zones. Therefore, as soon as the fumigator clears the structure, you may return to your home.
